Important: Solution Pattern Disclaimer

This document and the accompanying unmanaged package are intended solely for informational and demonstration purposes (proof-of-concept). They illustrate a conceptual framework for assembling generally available Agentforce and Salesforce Flow capabilities into a reusable solution pattern for Agentforce Employee Agent (AEA) Orchestrated Account Research.

All information, examples, prompt templates, Apex snippets, and the unmanaged demo package are provided for illustrative and educational purposes only. They are not production-ready and require partner/customer design, security review, customization, testing, and validation to meet specific business, legal, and compliance requirements.

Salesforce provides this material “as is” without warranties of any kind and assumes no liability for any solution designed or implemented using these patterns. Partners and customers are solely responsible for the architecture, data handling, compliance, performance, and costs of any implementation. Purchasing decisions should be based only on currently and generally available Salesforce products and features; any references to future capabilities are for information only and not a commitment.

Extraction accuracy, latency, and outcomes depend on factors outside Salesforce’s control, including but not limited to: Generative AI model behavior, the availability and accuracy of public web data retrieved via the "Search the Web" action, and the specific phrasing of user prompts. Users should be aware that Large Language Models (LLMs) may occasionally produce inaccurate or "hallucinated" information.

Do not process sensitive or regulated data (MNPI, PII, PHI) in demos unless your environment is specifically configured for it.

Web Search: This solution utilizes the Agentforce "Search the Web" action. Customers are responsible for reviewing the data handling policies regarding external search queries and ensuring that the retrieval of public web data aligns with their organization’s security and compliance policies.

Verification: Users should independently verify all figures, dates, and claims produced by the Agent against official source documents.

Any risk analyses, financial summaries, strategic recommendations, or classifications produced by this solution are for operational guidance only and do not constitute legal, financial, or investment advice. Customers must obtain professional counsel and remain responsible for final business decisions based on this data.

Use of this solution utilizes Agentforce capabilities which may incur consumption-based costs depending on your specific Salesforce contract. The content retrieved via web search is third-party content; Salesforce does not own or verify the accuracy of external web data. Sample data and scenarios used in this guide are fictional; any resemblance to real entities is coincidental. All trademarks are the property of their respective owners.

Executive Summary

The Agentforce Employee Agent (AEA) Orchestrated Account Research solution is a native Salesforce pattern that automates the time-consuming process of gathering, analyzing, and synthesizing account intelligence.

Unlike traditional integration patterns that rely on hard-coded API calls to external research tools, this solution utilizes the cognitive reasoning of Agentforce itself. It treats the Agentforce Employee Agent as a "Researcher Sub-Agent," instructing it to perform recursive web searches, analyze the findings, and return structured intelligence to a backend automation flow.

High-level architecture:

- Trigger: A user asks their Agent (e.g., "Run a deep dive on Acme Corp") in the chat window.
- Orchestration: The Agent identifies the Account ID and hands off the request to an asynchronous background process (Queueable Apex).
- Recursive Research: A Flow launches and calls the Employee Agent multiple times. For each section of the report (News, Strategy, Competitors), the Agent uses the "Search the Web" action to find live data.
- Synthesis: Generative AI Prompt Templates transform the Agent's research notes into a polished, HTML-formatted report.
- Delivery: The final report is saved to a custom object and the user is notified via the bell icon.

You can also view a detailed process architecture here: [Mermaid Live Diagram](#)

Here is a brief demo video (< 2 min) showing this capability in Agentforce:

Install & Setup Guide (20 min)

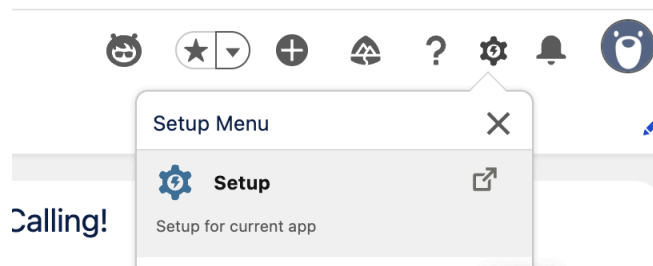

[Install & Setup Video Guide \(20 min\)](#)

Ensure Einstein Setup and Agentforce is Turned On

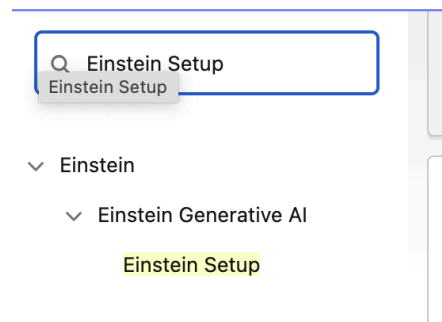

One of the prerequisites for using the Agentforce Employee Agent (AEA) Orchestrated Account Research Solution Pattern package is to have Einstein Generative AI & Agentforce setup. You can find detailed instructions here:

[Set Up Einstein Generative AI](#)

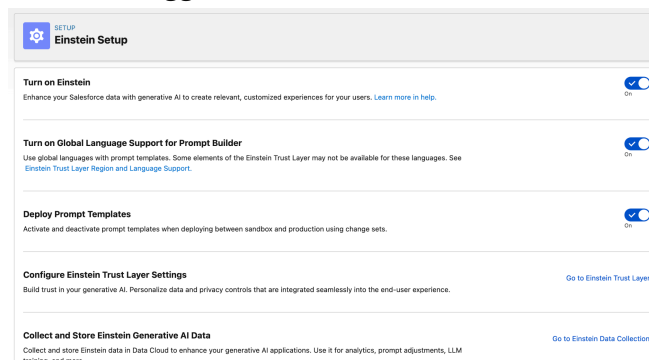

- Once logged in, go to **Setup** using the  gear icon in the upper right corner.

- Use the Quick Find search on the left hand side to search for **Einstein Setup**. Select **Einstein Setup**.

- Ensure **Turn on Einstein** is toggled **On**.

- Use the Quick Find search on the left hand side to search for **Agentforce Agent**. Select **Agentforce Agents**.
- Make sure **Agentforce** is toggled **On**.

IMPORTANT:

- Before installing, ensure Einstein Generative AI and Agentforce have been set up in your Salesforce org.
- If you run into an error, retry and select "Rename conflicting components in package" when you install

Install Package

High-Level Package Components: *(Package Glossary at the end of this document)*

- 2 Apex Classes
- 3 Flows
- 2 Agent Topics (Plugin Definitions)
- 2 Agent Actions (Function Definitions)
- 5 Prompt Templates
- 1 Custom Object
- 1 Custom Notification Type
- 1 Lightning Record Page

Follow the steps below to configure the solution after installing the unmanaged package.

Step 1: Configure the Research Sub-Agent

This agent acts as the "Brain" in the background. It is called by the automation flow to perform the heavy lifting of recursive web search and synthesis.

1. Navigate to **Setup > Agentforce > Agentforce Agents**.
2. Click **New Agent**.
 - a. Agent Type: Employee.
 - b. Name: Research Specialist (or similar).
 - c. Description: An internal agent dedicated to performing deep-dive web research.
 - d. Click Create.
3. Once in the Agent Builder, locate the Topics section.
4. Click **New > Add from Asset Library**.
5. Select the Topic: In_Depth_Web_Research.
6. Critical Configuration:
 - a. Click into the In_Depth_Web_Research topic you just added.
 - b. Select the This Topic's Actions tab.
 - c. Ensure the native "Search the Web" action is added and active. This is required for the agent to access external data.
7. Activate this agent.
 - a. Note the API Name of this agent (e.g., Research_Specialist). You will need to ensure the Flow Agentforce Account Research Report Creator Flow AEA is referencing this specific agent in its "Generate AI Agent Response" elements.

Step 2: Configure the User-Facing Agent

This is the agent your users interact with in the chat window. It acts as the "Orchestrator" to trigger the process.

1. Navigate to **Setup > Agentforce > Agentforce Agents**.
2. Select your primary employee-facing agent (e.g., Agentforce Employee Agent).
3. Click **Open in Builder**.
4. In the Topics section, click New > **Add from Asset Library**.
5. Select the Topic: Agentforce_Account_Research_AEA.
6. Verify Actions:
 - a. Click into the topic and ensure the action Start_AEA_Account_Research_Report is present.
 - b. Ensure standard Salesforce actions like IdentifyRecordByName and GetRecordDetails are available to this agent (usually via the General CRM topic, or added specifically to this topic) so it can resolve the Account Name to an ID.
7. Activate the agent.
8. Make sure your user(s) has access to this agent:
 - a. Your Agent Name > Agent Access > Configure by Permission Set or Profile

Step 3: Configure the Flow (Agentforce Account ResearchReport Creator Flow AEA)

Now we need to add the research sub-agent that you created in **Step 1** to the flow that orchestrates the research and map the proper variables to the new flow actions. It is highly recommended to watch the implementation guide video from the 8:00-14:00 to see this implemented in detail.

1. Navigate to **Setup > Flows > Agentforce Account Research Report Creator Flow AEA**
2. Click the + in-between the "Get most Recent Account Research Report" and the "Account Intelligence Research Report Generator" actions.
3. Select **Action** > search for the name of the research sub-agent you created in step 1 > **Select the Agent**
4. Configure the Agent in Flow:
 - a. API Name: AEA_Overview_and_Recent_News (or similar)
 - b. Agent Request: Insert Resource > Text Templates > prompt_Overview_Recent_News ({{prompt_Overview_Recent_News}})
 - c. Select Manually assign variables (advanced)
 - d. Agent Response > Variables > response_Overview_Recent_News_JSON ({{response_Overview_Recent_News_JSON}})
5. Click the + and select **Action** > search for the name of the research sub-agent you created in step 1 > **Select the Agent**. Again (like the previous step), configure the Agent in Flow as follows:
 - a. API Name: AEA_Competitive_Positioning (or similar)
 - b. Agent Request: Insert Resource > Text Templates > prompt_Competitive_Position_Market_Landscape ({{prompt_Competitive_Position_Market_Landscape}})
 - c. Select Manually assign variables (advanced)
 - d. Agent Response > Variables > response_Competitive_Positioning_Landscape ({{response_Competitive_Positioning_Landscape}})

6. Click the + and select **Action** > search for the name of the research sub-agent you created in step 1 > **Select the Agent**. Again (like the previous step), configure the Agent in Flow as follows:
 - a. API Name: AEA_Strategic_Priorities (or similar)
 - b. Agent Request: Insert Resource > Text Templates > prompt_Strategic_Priorities_Opportunities ({{prompt_Strategic_Priorities_Opportunities}})
 - c. Select Manually assign variables (advanced)
 - d. Agent Response > Variables > response_Strategic_Priorities_Opportunities ({{response_Strategic_Priorities_Opportunities}})
7. Click the + and select **Action** > search for the name of the research sub-agent you created in step 1 > **Select the Agent**. Again (like the previous step), configure the Agent in Flow as follows:
 - a. API Name: AEA_Tech_Insights (or similar)
 - b. Agent Request: Insert Resource > Text Templates > prompt_Tech_Insights_Partnerships ({{prompt_Tech_Insights_Partnerships}})
 - c. Select Manually assign variables (advanced)
 - d. Agent Response > Variables > response_Tech_Insights_Partnerships ({{response_Tech_Insights_Partnerships}})
8. Select **Save As New Version**.
9. **Activate** the newly modified flow.

Step 4: Configure the User Interface on the Account Record Page

Now that the agents are configured, you need to surface the generated reports on the Account Record Page.

1. Navigate to any Account record in your Sales App.
2. Click the Setup Gear icon (top right) and select Edit Page.
3. Add the Tab:
 - a. Click on the main Tabs component in the center of the canvas.
 - b. In the properties pane, click Add Tab.
 - c. Change the Tab Label to Custom and name it "Account Research".
4. Add the Related List:
 - a. Click on the new "Account Research" tab you just created on the canvas to select it.
 - b. From the component palette on the left, drag the Dynamic Related List - Single component into this tab.
5. Configure the Related List:
 - a. Parent Record: Use This Account.
 - b. Related List: Select Account Research Reports.
 - c. Related List Type: List.
 - d. Number of Records: 10.
 - e. Related List Fields: Add fields such as Report Name, Is Most Recent?, Run Date/Time, and Report Summary.
 - f. Sort Order: Field: Run Date/Time, Order: Descending.
6. Click Save and Activate (assign as Org Default if necessary).

Step 5: Validate the Setup

1. Open the Agentforce Chat in your utility bar.
2. Enter the prompt: "Run a deep dive research report on [Account Name]".
3. Verification:
 - a. The User-Facing Agent should reply confirming the process has started.
 - b. Wait approximately 2-5 minutes.
 - c. You should receive a Bell Notification indicating the report is ready.
 - d. Navigate to the Account Record > Account Research tab to see the newly created report.

Package Glossary

Flows

Flow (API Name)	Type	Purpose
Agentforce_Account_Research_Report_Creator_Flow_AEA	Autolaunched	The "Engine." It orchestrates the recursive research loop. It calls the Employee Agent (via generateAiAgentResponse) multiple times to gather data, passes that data to Prompt Templates for synthesis, and creates the final Report record.
Agentforce_Account_Research_Task	Autolaunched	The "Q&A" utility. It enables the user to chat with the report after it is created (e.g., "Summarize the risks in this report").
Agentforce_Account_Research_Report_Creator_Maintain_Most_Recent_Flag	Record-triggered	On insert of a new report, unchecks Is Most Recent? on all older reports for that Account.

Agent Topics (Plugin Definitions)

Topic API Name	Role	Function
Agentforce_Account_Research_AEA	Orchestrator	User Facing. This topic identifies the Account ID from the user's prompt (e.g., "Salesforce") and launches the background process.
In_Depth_Web_Research	Researcher	System Facing. This topic is used by the backend Flow. It instructs the Agent to perform 5-step recursive web searches to gather high-density information.

Agent Topics (Plugin Definitions)

Action Name	Type	Purpose
Start_AEA_Account_Research_Report	Apex (Invocable)	The trigger mechanism. It accepts an Account ID and hands the process off to the asynchronous Queueable job.
Agentforce_Account_Research_Task	Flow	Wraps the "Account Research Task" flow so the Agent can invoke it to answer questions about specific report records.

Apex Classes

Action Name	Purpose
AEA_Account_Research_Flow_Starter	Invocable. The entry point called by the Agent. It queues the job and returns the "I have started research..." toast message to the user.

AEA_Account_Research_Queueable	Queueable. The background worker. It launches the long-running Flow asynchronously to prevent chat timeouts.
--------------------------------	--

Prompt Templates

Prompt Template Name	Purpose
Account_Intelligence_Research_Report_Generator	The "Writer." Takes the raw text notes from the Agent and formats them into the final 6-section HTML report.
AEA_Source_Counter	The "Auditor." Parses the Agent's text response to count unique hyperlinks/citations.
Account_Intelligence_Research_Summarizer	The "Summarizer." Creates the bulleted summaries for the specific fields on the record (e.g., Recent_News_Summary__c).
Account_Intelligence_Research_Report_Comparison	The "Analyst." Compares the new report text against the previous report text to generate the "What's Changed" section.
Agentforce_Account_Research_Task	The "Assistant." Used when a user asks a follow-up question about an existing report record.

Custom Object

Object	Description
Account_Research_Report__c	Stores the generated HTML report, the summaries, and the comparison analysis. It is a child object of Account.
